## Custom Designed Keel Coolers For Any Application

**F**or marine applications requiring unique or custom cooling systems, Fernstrum GRID-COOLER® keel coolers are always a perfect fit. We have design flexibility unmatched by any other manufacturer. Because approximately 30% of all units we manufacture are custom designs, we can easily tailor a unit to your specific application. This is possible through our desire to meet your individual needs and our utilization of extensive computer technology throughout the design process.

GRIDCOOLER units can be factory customized in many different ways. If you have a given area in which to place a cooler, we will work with you to custom design a unit to meet those requirements. We can bend units to conform to your hull's profile, add special fittings or even stack

tubing to fit your application. Such special requests have led to several special series of units.

- **Our L SERIES™** support plates are designed to eliminate intermediate support bolt hull penetrations.
- **Our E1 SERIES™** units place the zinc anodes and drain bosses on the end of the keel cooler, a benefit to high-speed craft and fishermen.
- **Our Z SERIES™** flanges simplify keel cooler installation on double hulled vessels and eliminate hull penetrations. (Patent pending)

These examples are only a few of the many special needs we have met for our customers. If you have a unique marine cooling application, give us a call. We will gladly work with you to design a keel cooling system to meet your needs.
